

AI Usage DISCLOSURE FORM

1. Team Details

Team Name: SamSung, We Coded

Project / Product Name: Interject — Interruptible Real-Time Agent

Organization / Institution (if any): MSRIT

Submission Date: 30 September 2026

2. AI Usage Declaration

Did your team use any Artificial Intelligence (AI) in developing this project? Yes / No

Yes — AI was used as an assistive development tool, primarily for code generation/review, UI building, debugging, testing support, and presentation/content drafting.

3. Purpose of AI Usage (Brief Details)

Idea generation / brainstorming — **Human-led**

The team defined the problem framing, the “Interject” concept and the overall approach. AI was not the source of the project idea.

Code generation or assistance — **AI-assisted**

An AI coding assistant (Claude, Anthropic) helped write and modify code under the team's direction. Every change was reviewed and tested by the team.

UI / UX design — **AI-assisted**

The landing page, sign-up/login screens, theme toggle and in-app notices were built with AI assistance to the team's design requirements.

Content creation — **AI-assisted**

README sections, the fictional demo knowledge base and presentation slides were drafted with AI and edited by the team.

Data analysis — **Human-led**

The team ran the benchmark and interpreted the results. Conclusions and next steps were decided by the team.

Testing / debugging — **AI-assisted**

AI helped write automated backend and browser tests and diagnose bugs. The team verified fixes, including a clean-machine test on a teammate's laptop.

Other — **AI-assisted documentation/review**

AI assisted with documentation and reviewing changes. The product also uses AI models at run time: Groq Whisper, NVIDIA and Groq gpt-oss models, Piper voice and Silero voice detection.

4. Feature Origin Classification

1. Feature Name: BACKSPACE dependency-aware interruption and recovery

2. Self-Generated/AI-Generated/Both: **Both**

3. Description: The team designed BACKSPACE: when the user interrupts or corrects themselves, work that depended on the superseded input is invalidated, useful work is kept in a checkpoint, and actions run at most once. AI tool: Antigravity. Prompts (examples): “fix the hold on bug”, “improve the benchmark agent's tool calls”. Output summary: fixes to hold/resume, the benchmark adapter's argument normalisation, and automated tests. Modification: the team reviewed and tested every change and kept the original design.

2. Feature Name: Realtime agent integration and provider layer

2. Self-Generated/AI-Generated/Both: **AI- Generated**

3. Description: LiveKit voice agent for Full-Duplex-Bench v3 and the web app's model providers. AI tool: Antigravity . Prompts (examples): “find free providers for the 100-recording benchmark”, “use Groq first for the app and NVIDIA first for the benchmark”. Output summary: Groq Whisper → NVIDIA gpt-oss-20b → local Piper pipeline, a backup model that takes over on errors, an honest offline mode, and the one-command benchmark script. Modification: the team chose the providers and their order, ran the benchmark and approved each change.

3. Feature Name: Product architecture, problem framing, and final design decisions

2. Self-Generated/AI-Generated/Both: **Both**

3. Description: The team independently defined the Theme 05 problem framing, the BACKSPACE concept, the dependency-aware recovery approach, the system architecture, task division and final engineering decisions. AI tools Antigravity, Chatgpt and Claude supported the implementation and documentation of these decisions; they were not the origin of the design. Modification: all decisions were made and approved by the team.

5. Ethical & Compliance Confirmation

AI usage complies with guidelines and policies. **Yes**

No proprietary or copyrighted data misused. **I Agree**

6. Declaration & Sign-Off

Name of Team Representative: P NISHANT

Role: Team Representative
